

Characteristics of Multi-Level Patterned Carpet

Solid-colour, Multi-level loop and cut and loop pile carpet may have as many as 3 different pile heights to create pattern effects. This dense type of construction provides creative designs, good durability and a casual more elegant look. Natural light will play an important role in the overall appearance of your carpet. You may need to consider the direction of the pile to lessen the tufting linearity and to reduce seam visibility that may be common with styles of this nature.

For best seam results:

- Seams should be kept to a minimum
- Seams should be run the length of the area
- Main traffic runs parallel to, not across the seam
- Natural light does not strike across the seam
- Seams are away from areas subject to pivoting traffic
- Seams are not perpendicular to doorway openings
- All cut edges must be sealed prior to seaming procedure
- Use a wider quality seaming tape to minimize peaking
